

Impact Statement Card

Potential benefit: consistent first-pass routing can help support teams find the appropriate queue sooner and reduce avoidable waiting time.

Potential harms: a category error can delay a response, particularly for fraud or account-access complaints. The training data may underrepresent real language variation, including code-switching, typos, rare cases, and accessibility needs.

Mitigations: treat output as a recommendation; show reviewers the original text; allow manual override; monitor per-category errors; and do not use the classifier as the only safety-critical escalation mechanism.

Grouped five-fold development validation produced a best out-of-fold macro F1 of 0.7556 for the MPNet model. This is not a guarantee of deployed performance.
